First look at the dplyr package. . . . .	8

## Background

There are lots of ways to make plots in R. These include so-called “base R” (like the `plot()`) and add-on packages like `ggplot2`.

Let’s make the same plot with these two graphics systems. We can use the inbuilt `cars` dataset:

```
head( cars )
```

```
speed dist
1      4    2
2      4   10
3      7    4
4      7   22
5      8   16
6      9   10
```

With “base R” we can simply:

```
plot(cars)
```

Now let's try ggplot. First I need to install the package using `install.packages("ggplot2")`.

**N.B.** We never run an `install.packages()` in a code chunk otherwise we will re-install needless every tiem we render our document.

Every time we want to use an add-on package we need to load it up with a call to `library()`

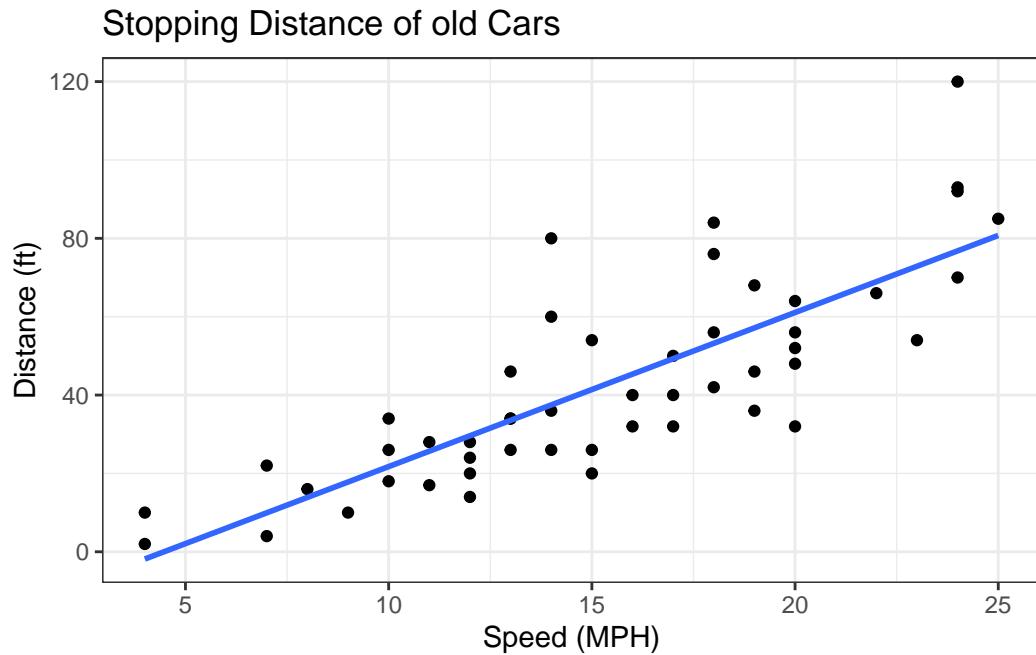

```
library(ggplot2)
ggplot(cars)
```

Every ggplot needs at least 3 things:

1. The **data** i.e. stuff to plot as a data.frame
2. The **aes** or aesthetics that map the data to the plot
3. The **geom\_** or geometry i.e. the plot type such as points, lines, etc.

```
ggplot(cars) +  
  aes(x=speed, y=dist) +  
  geom_point() +  
  geom_smooth(method = "lm", se = FALSE) +  
  labs(x="Speed (MPH)",  
       y="Distance (ft)",  
       title="Stopping Distance of old Cars") +  
  theme_bw()  
  
`geom_smooth()` using formula = 'y ~ x'
```

## Gene Expression Plot

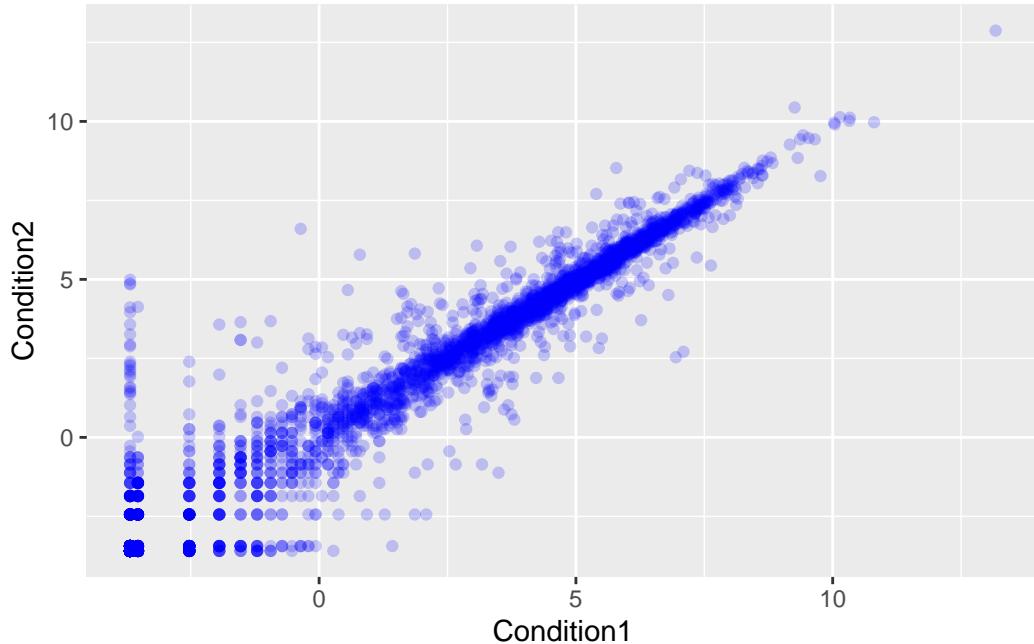

Read some data on the effects of GLP-1 inhibitor (drug) on gene expression values.

```
url <- "https://bioboot.github.io/bimm143_S20/class-material/up_down_expression.txt"
genes <- read.delim(url)
head(genes)
```

	Gene	Condition1	Condition2	State
1	A4GNT	-3.6808610	-3.4401355	unchanging
2	AAAS	4.5479580	4.3864126	unchanging
3	AASDH	3.7190695	3.4787276	unchanging
4	AATF	5.0784720	5.0151916	unchanging
5	AATK	0.4711421	0.5598642	unchanging
6	AB015752.4	-3.6808610	-3.5921390	unchanging

Version 1 plot - start simple by getting some ink on the page.

```
ggplot(genes) +
  aes(x=Condition1, y=Condition2) +
  geom_point(col="blue", alpha=0.2)
```

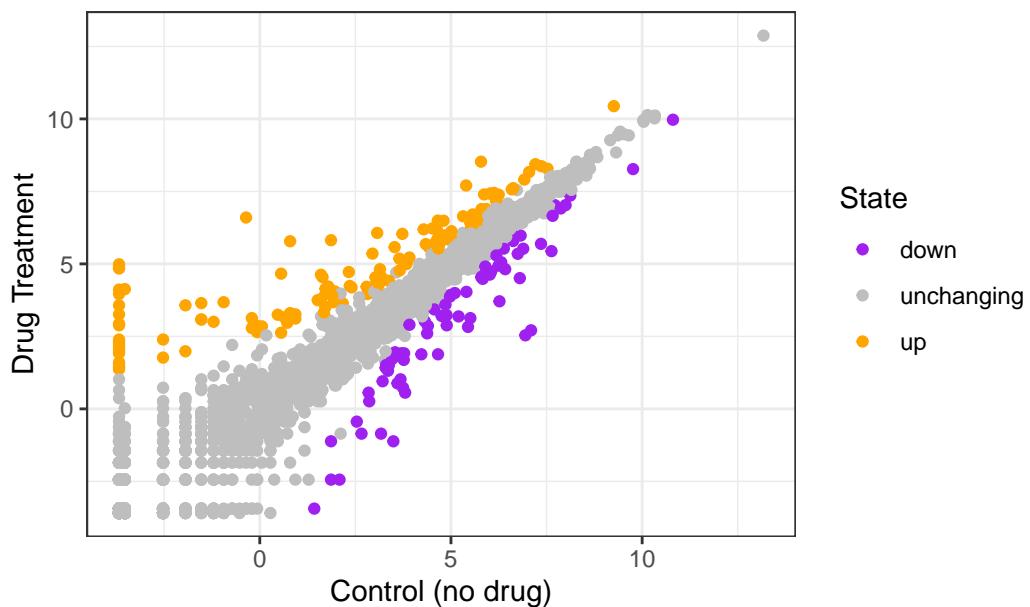

Let's color by `State` up, down, or no change.

```
table (genes$State)
```

	down	unchanging	up
72	72	4997	127

```
ggplot(genes) +
  aes(x=Condition1, y=Condition2, col=State) +
  geom_point() +
  scale_color_manual(values = c("purple", "gray", "orange")) +
  labs(x="Control (no drug)", y= "Drug Treatment", title="Gene Expression Changes Upon Drug
  theme_bw()
```

## Gene Expression Changes Upon Drug Treatment

## Going further with gapminder

Here we explore the famous `gapminder` data set with some custom plots.

```
# File location online
url <- "https://raw.githubusercontent.com/jennybc/gapminder/master/inst/extdata/gapminder.ts"

gapminder <- read.delim(url)
head(gapminder)
```

	country	continent	year	lifeExp	pop	gdpPerCap
1	Afghanistan	Asia	1952	28.801	8425333	779.4453
2	Afghanistan	Asia	1957	30.332	9240934	820.8530
3	Afghanistan	Asia	1962	31.997	10267083	853.1007
4	Afghanistan	Asia	1967	34.020	11537966	836.1971
5	Afghanistan	Asia	1972	36.088	13079460	739.9811
6	Afghanistan	Asia	1977	38.438	14880372	786.1134

Q. How many rows does this data set have?

```
nrow(gapminder)
```

```
[1] 1704
```

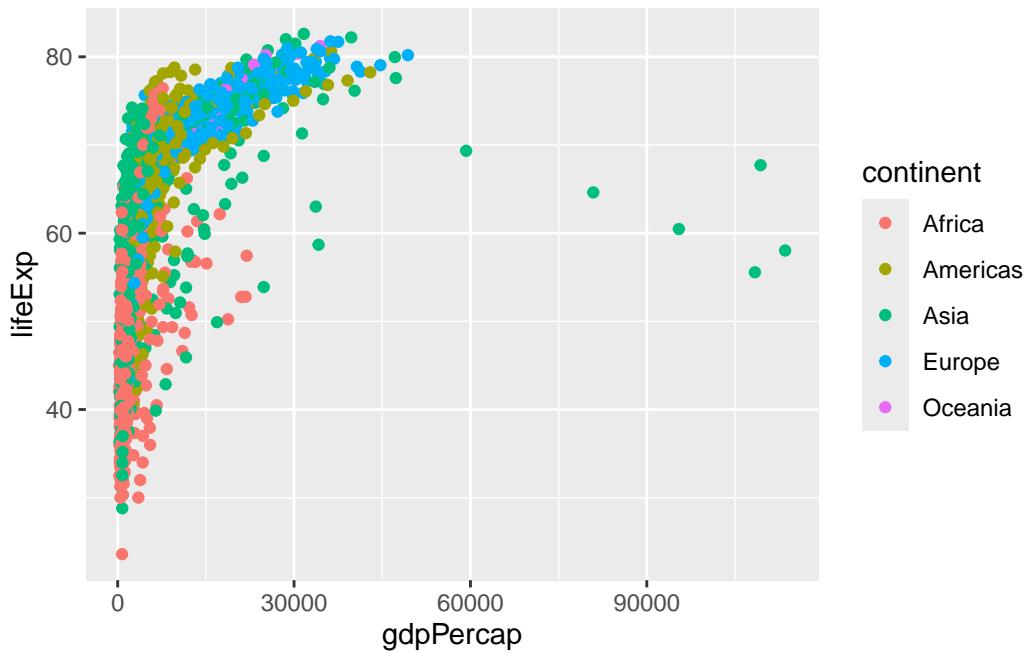

How many different continents are in this data set?

```
table(gapminder$continent)
```

	Africa	Americas	Asia	Europe	Oceania
	624	300	396	360	24

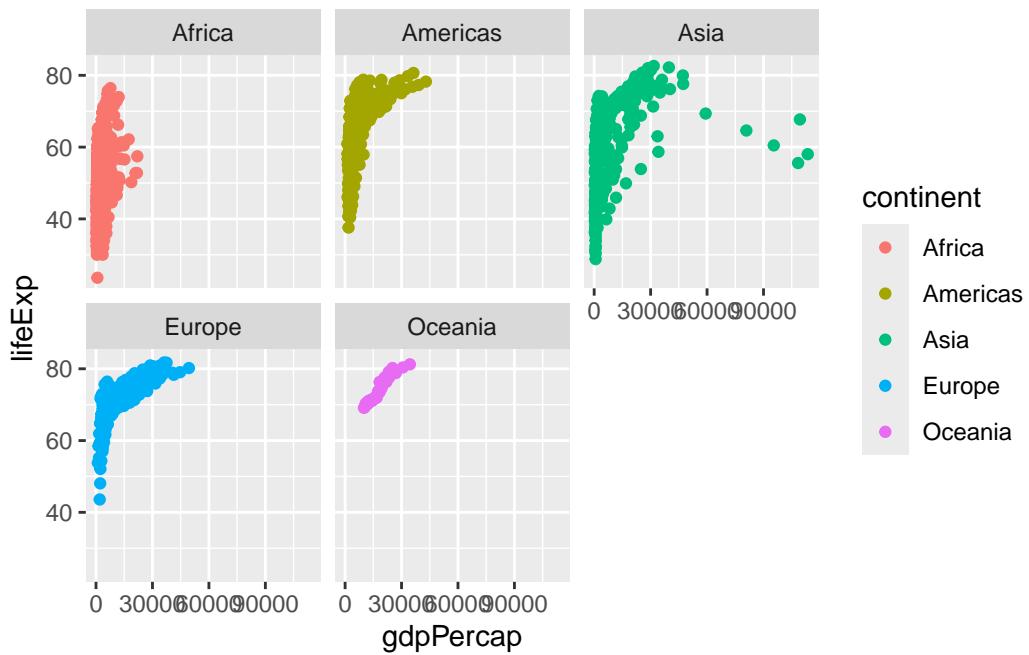

Version 1 plot gdpPercap vs LifeExp

```
ggplot(gapminder) +  
  aes(gdpPercap, lifeExp, color= continent) +  
  geom_point()
```

I want to see a plot for each continent- in ggplot lingo this is called “faceting”

```
ggplot(gapminder) +
  aes(gdpPercap, lifeExp, color= continent) +
  geom_point() +
  facet_wrap(~continent)
```

## First look at the dplyr package.

Another add-on package with a function called `filter()` that we want to use.

```
library(dplyr)
```

Attaching package: 'dplyr'

The following objects are masked from 'package:stats':

`filter`, `lag`

The following objects are masked from 'package:base':

`intersect`, `setdiff`, `setequal`, `union`

```
filter(gapminder, year==2007, country=="United States")
```

```
country continent year lifeExp      pop gdpPercap
1 United States    Americas 2007  78.242 301139947 42951.65
```

```
input <- filter(gapminder, year == 2007 | year == 1977)
```

```
ggplot(input) +
  aes(x=gdpPercap,y=lifeExp, col=continent) +
  geom_point() +
  facet_wrap(~year)
```
